Introduction

This document describes operating manual for bidirectional gateway EnOcean / RS 232, RS 485 Modbus RTU.

Type of device

Bidirectional gateway for EnOcean / RS 232, RS 485 Modbus RTU.

- Receiving, control and managing of wide EnOcean elements spectrum (e.g. temperature, humidity, motion, CO2 sensors, indication of opened doors/windows, on and off switches, actors, control modules, measuring electric current).
- It can serve up to 40 elements EnOcean.
- Standardized for frequency 868 MHz, possible option is 902 MHz.
- Supplied with EnOcean Tools application for comprehensive review of information and elements control.

Electromagnetic compatibility EMC:

The product is in conformity with provisions of Government Regulation No. 117/2016 Coll. which are in compliance with Directive 2014/30/EU regarding electromagnetic compatibility (EMC).

Czech version of standard:	Identical with European standard:
ČSN EN 55032 ed. 2:2017	EN 55032:2015
ČSN EN 61000-6-2 ed.3:2006	EN 61000-6-2:2005
ČSN EN 61000-4-2 ed.2:2009	EN 61000-4-2:2009
ČSN EN 61000-4-3 ed.3:2006+A1:2008+A2:2011	EN 61000-4-3:2006+A1:2007+A2:2010
ČSN EN 61000-4-4 ed.3:2013	EN 61000-4-4:2012
ČSN EN 61000-4-5 ed.3:2015	EN 61000-4-5:2014
ČSN EN 61000-4-6 ed.4:2014	EN 61000-4-6:2014

Safety information and warnings

The product meets the general safety requirements according to ČSN EN 61010-1 ed. 2.
Cover IP 20 allows installation only in normal space according to ČSN 33 2000-1 ed. 2.

The gateway must be powered from safe voltage source that meets requirements of ČSN EN 61010-1 ed. 2 and must be installed in accordance with national and safety standards.

The product may be only used in accordance with this manual.

To avoid a risk of an electrical shock or fire, the maximum of gateway's operating parameters must not be exceeded.

Use only unmodified products.

It can be used types of cables with sufficient electrical strength for connection.

Storage
Store products at temperature 0-40 °C and relative humidity up to 80 %, and in spaces where condensation on products is eliminated. Products must not be exposed shocks, harmful vapors or gases.

Repairs
Products are repaired by the manufacturer. Products to be repaired are shipped in a package that ensures shock absorption and protects the products against damage during shipment.

Guarantee
The product is warranted 24 months from the date of delivery that is mentioned on the delivery note. The manufacturer guarantees technical and operational products parameters in the range of valid documentation. The warranty period runs from personal goods acceptance by the buyer or from the transport company. Claimed products and written claims for defects are claimed by the manufacturer during warranty period. The complainant shall provide products identification, number of delivery note and defects description. The manufacturer is not responsible for defects caused by improper storage, improper external connection, damages caused by external influences especially due to unacceptable size, incorrect adjustment, improper installation, incorrect operation or normal wear and tear.

Product disposal

Product does not belong to municipal waste and belongs to separate collection.

1 Product description

Front side of gateway for EnOcean / RS 232, RS 485 Modbus RTU has six LED diodes. Green LED diode marked with the symbol *PWR* is used for indication, if supply voltage is connected. For supply voltage connection, it lights green permanently. Yellow LED diodes indicate communication. Diode marked with USB indicates communication via USB interface. Diode marked with RS 232 indicates communication on the line RS 232. Diode marked with *RS 485* indicate communication on the line RS 485 with the protocol MODBUS RTU. Diodes marked with R_x-EoN (receiving) and T_x-EoN (transmitting) are used for communication indication of EnOcean elements.

The gateway has two connectors for supplying DC supply voltage and connectors for communication with serial links RS 232 and RS 485. The gateway has also mini USB connector.

The gateway contains SMA connector for antenna connection.

Double DIP switch is used to balance idle state of the line RS 485 MODBUS RTU. For more information is written the chapter 3.

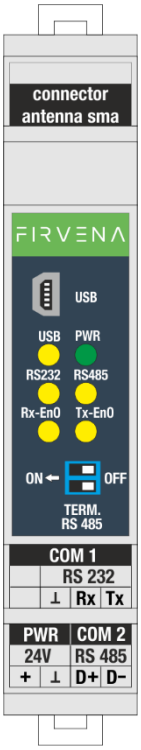

Fig. 2: *Front side of the gateway ENOCEAN-GWY-MOD*

1.1 Function description

The device ENOCEAN-GWY-MOD is gateway which wirelessly receives and controls elements through communication standard EnOcean and then communicates through communication interface RS 232 and RS 485 with the MODBUS RTU protocol. Gateway is designed for wide spectrum of elements with wireless EnOcean technology that is characterized with low consumption, frequent battery-free operation and use of alternative energy source.

Due to wireless technology, this solution finds its use in objects where the operation has been started or where new cables cannot be laid or if there is temporary rental space and the owner wants to take the device and elements with.

Gateway is able to transmit / receive all telegrams with type RPS/1BS, 4BS, VLD according to the specification EEP. Content of these telegrams is copied to registers. It is required for data in such format (RAW) knowledge of telegrams composition RORG and recalculation which burdens superior system. For this reason, there are converted values corresponding to the measured quantity for selected products. Selected products are being expanded according to actual needs of our customers.

1.2 Technical data

Tab. 1: *Technical data of gateway*

Electrical data	rated voltage	24 V DC (recommended value for power supply)
	range possibility for power supply	10 – 25 V DC
	own consumption of device	80 mA
	power consumption	1,92 W
Communication RS 232	protocol	MODBUS RTU slave
	supported functions	3, 6, 16
	baudrate	optional from 1,2 kBd to 115,2 kBd
	number of bits	8
	stopbit	1, 2
	parity	no, even, odd
	delay between received and sent message	basic + optional 0…200ms
	adjustable addresses	1…247
	max. number of device on the line	1
	indication	yes, LED yellow colour RS 232
Communication RS 485	protocol	MODBUS RTU slave
	supported functions	3, 6, 16
	baudrate	optional from 1,2 kBd to 115,2 kBd
	number of bits	8
	stopbit	1, 2
	parity	no, even, odd
	delay between received and sent message	basic + optional 0…200ms
	adjustable addresses	1...32 247
	max. number of device on the line	32
	indication	yes LED yellow colour RS 485
Communication USB	protocol	MODBUS RTU slave
	supported functions	3, 6, 16
	baudrate	115,2 kBd
	number of bits	8
	stopbit	1
	parity	no
	adjustable addresses	1
	max. number of device on the line	1
	indication	yes LED yellow colour USB
Number of EnOcean elements	Maximum number of EnOcean elements for 1 GWY	40
Supported elements of communication	RAW DATA: RPS/1BS, 4BS, VLD	
Operating valus	cover	IP 20
	operating temperature	-20 … +70^{O}C
	relative air humidity	max. 80 %

1.3 Gateway dimension

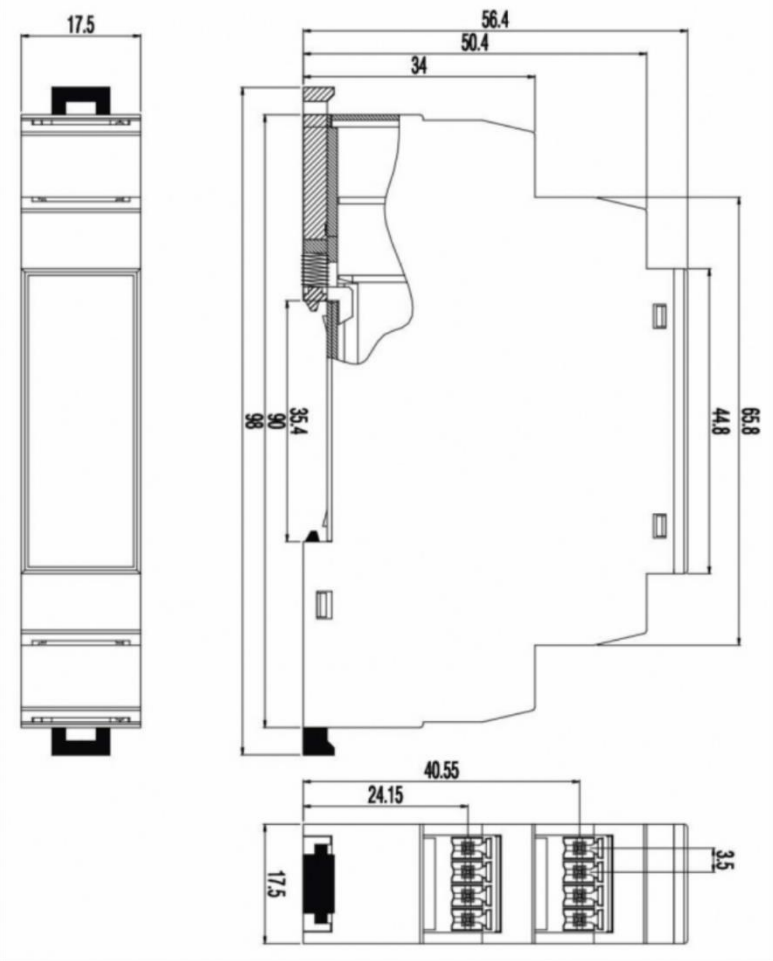

Fig. 3: *Gateway dimension*

1.4 Electrical installation

The device is intended to be used for installation into control cabinet in a DIN rail. After device installation, wires are connected to terminals.

Example for connection of stabilized DC supply voltage:

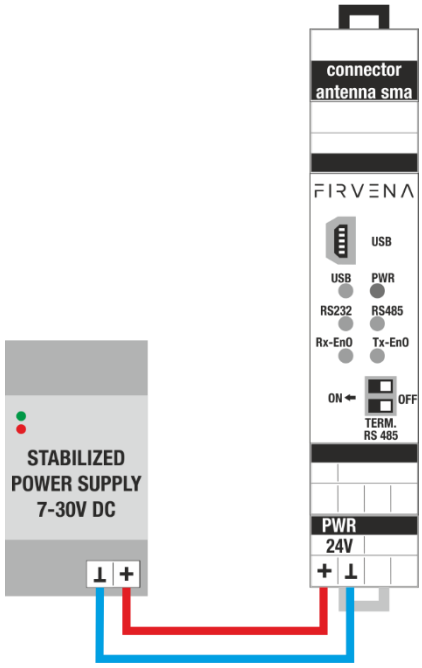

Fig. 4: *Connection of stabilized DC supply voltage*

Example for connection of communication through serial line RS 232:

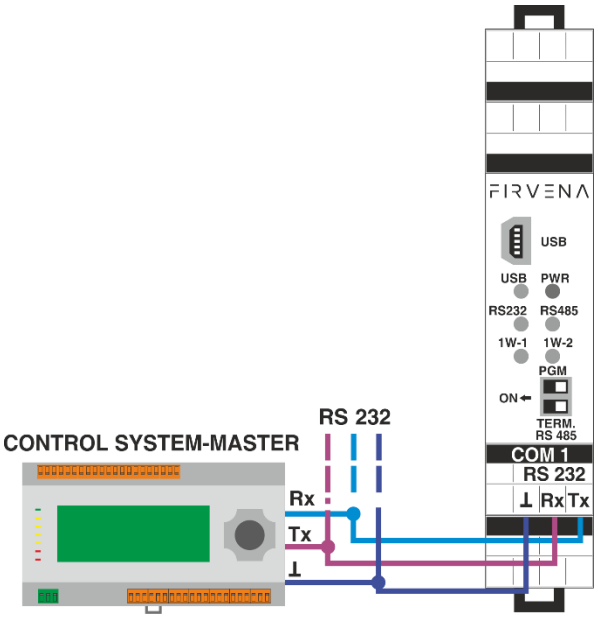

Fig. 5: *Connection of communication through serial line RS 232*

Example for connection of communication through serial line RS 485:

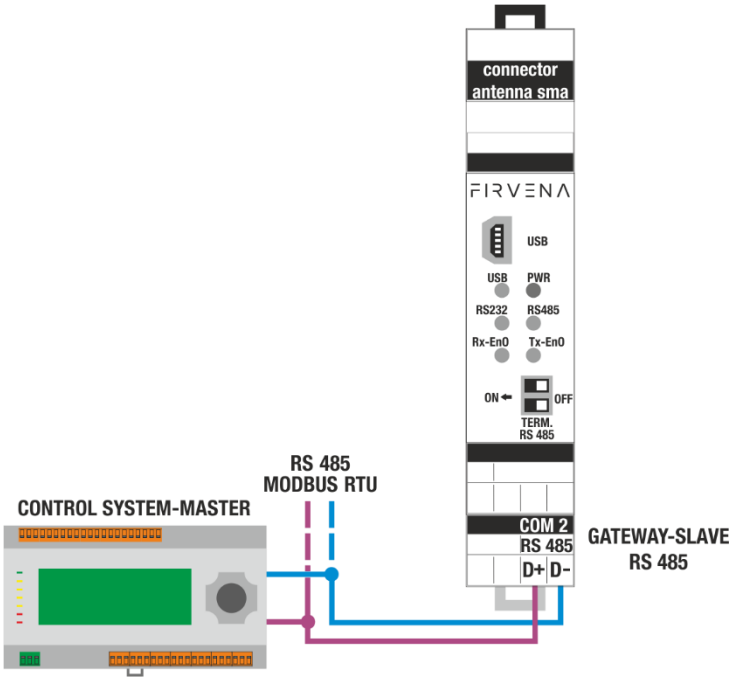

Fig. 6: *Connection of communication through serial line RS 485*

Example for connection of communication through USB interface:

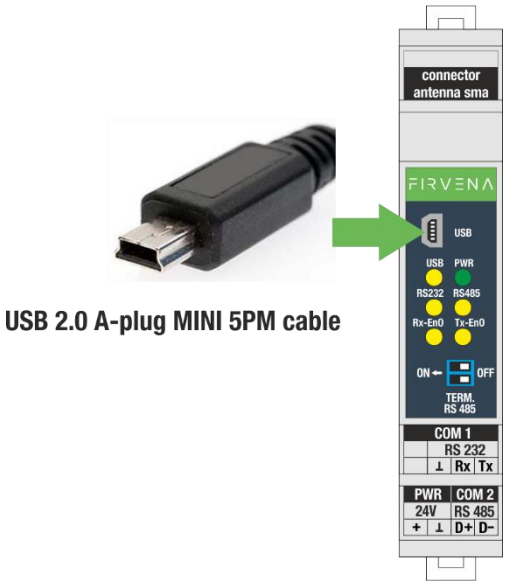

Fig. 7: *Connection of communication through USB interface*

2 RS 485 communication settings

Balance of idle state of the line RS 485 MODBUS RTU:

Communication serial line RS 485 MODBUS RTU in idle state, when no device transmits and all devices are to receive, the line is especially sensitive to induced voltage (faults) that may appear as incoming erroneous data.

For this reason, it is important to balance the idle state of the line by connection of appropriate resistors or terminators to one location on the line. It is implemented terminator in the device that is connected to the circuit with double DIP switch (see the Fig. 8). For long lines, we recommend to connect cable shield to GND.

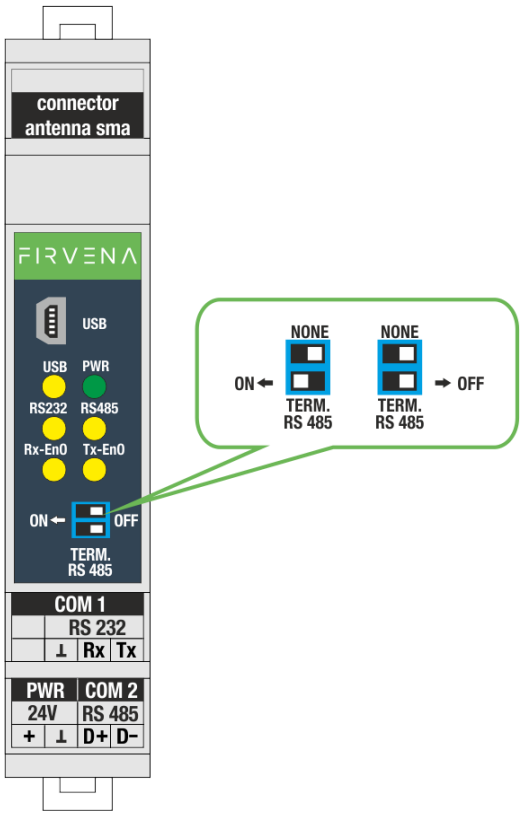

Fig. 8: *Function of double DIP switch*

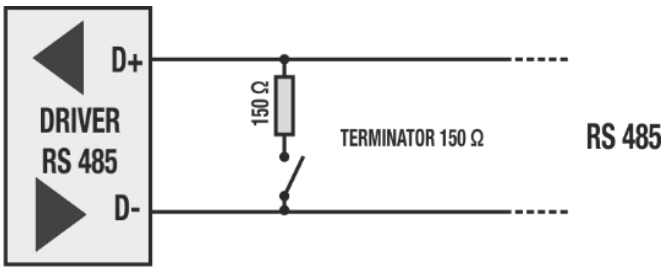

Fig. 9: *Connection of terminator 150 Ω*

3 MODBUS RTU communication description

Gateway receives data on frequency 868 MHz during its activity. It checks and process these data. Valid data are saved into prepared registers. These registers are readable by MODBUS RTU protocol.

3.1 Register map

There are a few registers assigned to each gateway in MODBUS RTU protocol.

Tab. 2: *Register map*

3.1.1 Register map – data

Each device has 10 registers in which measured and converted values of supported sensors are saved, then there are saved information about signal strength, number of received telegrams, time from the last receiving, and indication of error.

Values are converted according to assigned RORG.

These include for example: measured values of temperature, humidity, CO2, state of contact, etc.

Value 1 – Value 6:
It shows measured and converted values of the sensor, size of supply voltage, permission or prohibition of sensor use, etc.

Signal strength:
The receiver measures signal strength during receiving of messages and it adds this value to the message. Then it is possible to find out how much is the signal from different transmitters damped. This value is dependent on distance, number of barriers, etc. Information about quality of received signal is very useful for change of receiver or transmitters position or for antenna selection.

Time from the last receiving:
The gateway counts time from the last received message for each position. It is possible to find out from this information for example, how outdated the temperature data are and if sensor did not stop to transmit. In case of use more receivers that receive the same transmitters, these data are decisive for selection of valid value. The value is in seconds.

Tab. 3: *Register map - data*

	No	R/W	Description
Device 0	0	R	Value 1
	1	R	Value 2
	2	R	Value 3
	3	R	Value 4
	4	R	Value 5
	5	R	Value 6
	6	R	Signal strength
	7	R	Number of received telegrams
	8	R	Time from the last receiving
	9	R	Error
Device 1	10	R	Value 1

	18	R	Time from the last receiving
	19	R	Error

	...		
Device 39	390	R	Value 1
	391	R	Value 2
	392	R	Value 3
	393	R	Value 4
	394	R	Value 5
	395	R	Value 6
	396	R	Signal strength
	397	R	Number of received telegrams
	398	R	Time from the last receiving
	399	R	Error

Tab. 4: *Register map – error register*

Error register	
Value	Meaning of value
0	Message Ok
3	The type of sensor is not supported
7	Timeout (10 minutes without received data) (it hasn't worked for the time being)
255	The position is not occupied

3.1.2 Register map – ID data

The identification data determine which type of device it is. Identification data are saved in fields with ten registers for each device. These ID data start with the address 400. It is possible to edit them separately with function F-06 or collectively with function F-16.

It is possible to set RORG for values: 0xF6, 0xD5, 0xD2, 0xD1, 0xA6, 0xC6.

If different value is selected for RORG, the value doesn't display neither for FUNC nor TYPE.

ID0 – ID3:
It determines serial number of connected device.

RORG:
It determines type of supported EnOcean protocol (e.g..: RPS, 1BS, 4BS. VLD).

FUNC:
It determines function of the device (e.g.: temperature sensor, humidity sensor, gas sensor, light sensor, motion sensor, switching contacts, switches, etc.).

TYPE:
It determines type of device (e.g.: gas sensor – CO2, Radon, temperature sensor – from 0 to +40 °C, from -20 to +60 °C, etc.).

Tab. 5: *Register map – ID data*

	No	R/W	Description
Device 0	400	R	ID0
	401	R	ID1

	796	R	TYPE
	797	R	
	798	R	
	799	R	

3.1.3 Register map – current changes

To monitor currently received messages quickly, data about currently received messages are reserved in register fields.

Registers with the address from 900 to 920 contain currently received message.

The stack is available for forty currently received messages.

After reading of register with the number 901 (sending a block with this address), the message is deleted and newer messages will appear at this position.

Tab. 6: *Register map – current changes*

	No	R/W	Description

Tab. 8: *Register map – service data – address 1010*

Address 1010 - COMMAND	
Value	Meaning of value
0x0F00	It deletes receiving channel on position 0 (0x0F01 – position 1 … 0x0F27 – position 39)
0x1F00	It deletes transmitting channel on position 0 (0x1F01 – position 1 … 0x1F3B – position 59)
0x0900	It saves new sensor on position 0 (0x0901 – position 1 … 0x0927 – position 39)
0x11AA	SW Reset of the entire device

Tab. 9: *Register map – service data – address 1011*

Address 1011 – Status	
Value	Meaning of value
0x1100	Start without programming
0x1101	Start – new program has error CRC
0x1102	Start – new program is the same as the current one
0x1103	Start reprogramming was successful
0xFFFF	Command was executed successfully
0xEEE1	Unknown position
0xEEE2	Unknown command

Repeater
It is possible to set the gateway with the register 1060 as repeater. It manages to forward values in two levels in the net.

Option to activate one and two-level repeater for EnOcean radio telegrams:

Level 1 – If a received telegram is valid and original (not yet repeated), the telegram is repeated with a random delay. This delay will be chosen such a way, that the maximum TX validity time (as standardized in ISO 14543-3-10) will not exceed 40 ms.

Level 2 – If a received telegram is valid and original or repeated once, the telegram is repeated with a random delay. The limit is only in message validation, because each telegram can be resent only three times. This delay is chosen in such a way, that the maximum validity time (as standardized in ISO 14543-3-10) will not exceed 40 ms.

3.1.5 Register map – RAW data

At the address 2000 received data are displayed in raw state, how they were received.

The user converts the values then according to his needs.
Copies of received data are stored in registers with addresses from 2000 to 2399. Ten registers are prepared for each entry. First four registers contain ID number for easier orientation. Then there are types of telegrams and received data.

3.1.6 Register map – Pressac

User registers for the company Pressac Communications Ltd.

User registers for measuring electric current with CT clamp are ready at the address 3000.

Tab. 11: *Register map – Pressac*

	No	R/W	Description
Device 0	3000	R	ID 3 Hi , ID2 Lo
	3001	R	ID 1 Hi , ID0 Lo
	3002	R	Telegram type (0,1,2)
	3003	R	Power fail (1,0)
	3004	R	Divisor (1,0)
	3005	R	0 (reserved)
	3006	R	Value 1 (Type 0, Type 1, Type 2)
	3007	R	Value 2 (Type 1, Type 2) (0xFFFF for Type 0)
	3008	R	Value 3 (Type 2) (0xFFFF for Type 0, Type1)
	3009	R	Reserved (0xFFFF for Type 0, Type1) (0 for Type 2)
Device 1	3010	R	ID 3 Hi , ID2 Lo
	3011	R	ID 1 Hi , ID0 Lo
	3012	R	Telegram type (0,1,2)

	3394	R	Divisor (1,0)
	3395	R	0 (reserved)
	3396	R	Value 1 (Type 0, Type 1, Type 2)
	3397	R	Value 2 (Type 1, Type 2) (0xFFFF for Type 0)
	3398	R	Value 3 (Type 2) (0xFFFF for Type 0, Type1)
	3399	R	Reserved (0xFFFF for Type 0, Type1) (0 for Type 2)

3.1.7 Register map – TX

- Register map for transmitting preselected telegrams start at address 5000.
- It is possible to transmit up to 40 preset telegrams.
- 20 registers are reserved for each command.
- As Source ID it is possible to use ID of transmitter (registers 1022 – 1026)
- As Source ID it is possible to use BASE ID (0xFF, 0x01…0x28)

The transmitting is available on 40 channels. It is not about frequency, the frequency is always the same, it is about virtual transmitters with different ID number. ID numbers of transmitters are in the range FF-FF-FF-(01H … 28H). The EnOcean transmitter supports such a format of ID numbers. Virtual ID number are not completely unique and it is necessary to pay attention not to cover in case of use of more transmitters.

ID3 = 255, ID2 = 255 dec, ID1 = 255 dec, ID0 = 1..40 dec

If value 0xFF is added to transmitting register source ID0, the gateway will add default ID, that was added from the production to transmitting module, automatically during approximately half a minute.

4 Supported functions

It is possible to communicate with gateway in the net MODBUS RTU with following functions:

- Function 3 enables to read any registers in its memory range. Available registers return zero.
- Function 6 sets values in (adjustable) registers. It is used to set transmitted message and for its sending.
- Function 16 is used only for writing new ID number into gateway's memory.

5 Software tool EnOcean Tools

The tool is prepared for simple administration of all elements serviced with gateway through you can connect or disconnect EnOcean elements to and from gateway, monitor their states, values, communication intervals and signal strength. Another useful function is the possibility to control EnOcean elements from the gateway side. When there are installed more gateways, the tool enables to monitor and compare on which gateway each element has better signal and to assign the element with better signal to its gateway. You can assign the elements on position with use of ID number manually or automatically. The type of communication (RS 232, RS 485, USB) and baud rate can be set with this software. The baud rate for USB is default 115,2 kBd.

6 Supported profiles of device (EEP) for receiving data

6.1 Supported 4BS telegrams

A5-02-xx Temperature sensors		
EEP	**Registry**	**Popis**

Learning mode Variation 3

The learning mode for MD15-FTL-HE is in the form query – answer. The gateway makes this process automatically. It is necessary to follow the procedure.

1. Fill in actuator ID to registers for transmitting channels.
2. Fill in RORG, TYPE, FUNC.
3. Set register Teach-in on 1.
4. Set Value 2 for transmitting to the register (send once after receiving).
5. Press button on actuator, the process „teach-in“ will start.

	Value 2	Channel address Channel (1)
	Value3…7	Not used
	Teach-in	0
CMD – 0x03	Value1	CMD = 3 Query Position and Angle

	Value 2	Channel address Channel (1)
	Value3…7	Not used
	Teach-in	0
CMD – 0x05	Value1	CMD = 5 Set parameters
	Value 2	Channel address Channel (1)
	Value3	Measured duration of a vertical run 0 ... 499: Reserved 500...30 000: 5000...300000 ms (500 = 5s… 30 000 = 300s) 32767 (0x7FFF): -> No change
	Value4	Measured duration of rotation 1...254: 10...2540 ms (1 = 0,01s … 254 = 2,54s) 0: No rotation 255: -> No change
	Value5	Set alarm action Besides locking all other commands entering the alarm mode results in 0: No action 1: Immediate stop 2: Go up (0%) 3: Go down (100%) 4 ... 6:Reserved 7: -> No change
	Value6…7	Not used
	Teach-in	0

VLD Teach-in process

For learning process VLD, the command UTE is used.

D4-XX-XX		
EEP	**Registers**	**Description**
	Value1	DB6.7 0b0 Unidirectional communication (EEP operation) 0b1 Bidirectional communication (EEP operation) DB6.6 0b0 EEP Teach-In-Response message expected 0b1 No EEP Teach-In-Response message expected DB6.5 ... DB6.4 0b00 Teach-in request 0b01 Teach-in deletion request 0b10 Teach-in or deletion of teach-in, not specified 0b11 Not used
	Value 2	DB_5 Number of individual channel to be taught in
	Value3	DB_4 MID (8LSB) Manufacturer-ID (8LSB)
	Value4	DB_3 MID (3MSB) Manufacturer-ID (3MSB)
	Value5	DB_2 TYPE
	Value6	DB_1 FUNC
	Value7	DB_0 RORG

8 Saving characters for channels descriptions

Short description with lenght 40 characters can be connected to each transmitting (60) and receiving (40) channel. These characters are saved in registers with the address 10000-20000.

	No	R/W	Description
Device Rx 0	10000	R	0
	10001	R	12 (Length)
	10002	R/W	„T“ (First ascii char 0x54)
	10003	R/W	„e“ (0x65)
	…	R/W	„mperatu“
	10011	R/W	„r“ (0x72)
	10012	R/W	„e“ (0x65)
	10013	R/W	„1“ (0x31)
	…	R/W	0
	10099	R	0
Device Rx 1	10100	R	0
	10101	R	12 (Length)
	10102	R/W	„T“ (First ascii char 0x54))
	10103	R/W	„e“ (0x65)
	…	R/W	„mperatu“
	10111	R/W	„r“ (0x72)
	10112	R/W	„e“ (0x65)
	10113	R/W	„2“ (0x32)
	…	R/W	0
	10199	R	0
Device Tx 59	19900	R	0
	19901	R	9 (Length)
	19902	R/W	„A“ (First ascii char 0x41))
	19903	R/W	„c“ (0x63)
	…	R/W	„tuat“
	19911	R/W	„o“ (0x6F)
	19912	R/W	„r“ (0x72)
	19913	R/W	„2“ (0x32)
	…	R/W	0
	19999	R	0

9 Revision history

Tab. Document revision history

Date	Version	Modifications made
2nd March 2018	1.3	Supported 4BS telegrarams (chapter 7.1) Supported 4BS telegrarams (chapter 8.3)
10th October 2018	1.4	Repair connection RS 232, text corrections
25th October 2018	1.5	Enlargement of supported MSC telegrams for PRESSAC 3 channel temperature
17th December 2018	1.6	Repair of technical information
22nd February 2019	1.7	The protocol D2-01-0C added
4th March 2019	1.8	The protocol D2-01-0F (page….) added
10th May 2019	1.9	EEP protocols and desription of saving channel descriptions added
13th August 2019	1.10	Transmitting protocols A5-04-(01,02,03) a A5-05-01 added
21st May 2020	1.11	D2-03-0A added
30th January 2023	1.12	Text corrections
